The LCD one is a LCD5501232-433 and it chimes when first connected, it still works after it gets the time from the controller. Within a few minutes, the chime stops working. I can still do the \*4 to turn the chime on and off and this is shown on the display, but the chime will not sound. If I power down the keypad and power it back up, it will again work at first. Any ideas? thanks! Join Date: Jun 2000 Location: Gainesville, FL, USA Posts: 15,781 Received 350 Upvotes on 325 Posts What did you set the zone as? If you accidentally set it as one of the interior type zones, then it will not chime. got it! Hi MrRonFL, I figured it out. The zones were correct, but the LCD keypad's sound type was not set, so it wasn't working. I just set it to 1 and now it is all working. Thanks! The chime feature will omit a short beep from the keypad when a perimeter device like a door or window is opened.Here are some steps to take to troubleshoot why the chime may not be working: This feature can be turned on or off from your keypad.Ensure that the chime feature is turned on.You can find instructions on how to control the chime in your security system in your user manual here. Check the keypad to see if it shows any open zones. If the door/window sensor is showing as open on the keypad when its actually closed, give us a call at 1.800.PROTECT (1.800.776.8328)for assistance. This file includes instructions for the DSC PC3000 For complete instructions, click the above link for the pdf manual. Click Thumbnail for expanded keypad view. ARMING/DISARMING Check to see that the 'Ready' light is lit. Enter a 4-digit Access Code. The 'Armed' light will come on. Do not leave through an exit door. Check to see that the 'Ready' light is lit. Enter a 4-digit Access Code. The 'Armed' light will come on. Leave through an exit door. Enter your Access Code to disarm anytime the system is armed. If your code is invalid, the system will not disarm and a 2 second error tone will sound. If this happens hit # key, and try again. BYPASSING With the system disarmed. 1.Press \* 1. 2.Enter the 2-digit Zone Number(s) of the zones to be bypassed (01-16).3.To exit bypassing mode and return to the Ready state, press \*.Entering 0 0 instead of a 2-digit zone number will remove all bypasses. Bypassed zones are automatically canceled each time the system is disarmed and must be bypassed again, if required, before the next arming. RESETTNG SMOKE DETECTORS Some smoke detectors require entering a keypad command to reset them after an alarm. Press \* then hold down the 4 key for several seconds. If the smoke has cleared, the smoke detector will reset and the fire zone light will go out when the 4 keys is released. If the smoke has not cleared from the detector, open a window or door and fan clean air into the detector and try resetting again DOOR CHIME: 1.Enter \* 6 then the Master Access Code. The 'Program' light will be flashing.2.Press 6. The keypad will beep 3 times.3.Press # to exitRepeating this procedure will turn off this feature MEMORY LIGHT Lights to indicate that an alarm has occurred 1. Press \* 3 to view which zones generated the alarm.2.Press # to exitThe memory will be cleared when the panel is re-armed TROUBLE CODES Press \* 2 to enter trouble display. The 'Zone' lights will indicate the type of trouble condition 1.Low Battery2.AC Fail3.Day Zone Trouble4.Telephone Line Problem5.Failed Attempt To Communicate6.6. Bell/Siren Circuit Trouble7.Fire Zone Trouble8.Reset ClockPress # to exit trouble display. The 'Trouble' light will stay on until the trouble is resolved. Time & Date Programming 1.Press \* 6 plus your Master Access Code to enter User Functions. 2.Press 1 to select Time & Date. 3.Enter the time in 24-hr. format (HH:MM). 4.Press # to exit programming.PROGRAMMING ACCESS CODES It is highly recommended that all requests for assistance with access codes be referred to the dealer! 1.Press \* 5 plus the (Master Access Code). The 'Program' light will flash and the 'Zone' lights will show which codes have already been programmed. Up to 16 codes can be programmed.2. Enter the 2-digit user number to be programmed (01-16). 3.Enter the new 4-digit Access Code4.Return to step 2 to program another code, or, Press # to exit. Take special care when changing the Master Code (Code 1). Errors changing the Master Code will likely require a service call from a technician to correct.The Master Code must not be deleted. To Erase a code, follow the same procedure, except, at step 3, enter \* \* \* \* instead of a 4 digit number. Join Date: Mar 2009 Posts: 4 Upvotes: 0 Received 0 Upvotes on 0 Posts dsc door chime dsc 832 pc5010 5501 keypad can anyone tell me how to turn the door chime on for zones 1,6,5 i hit \*4 and the it is displayed in the corner but there is no noise when i open the door Thanks Join Date: Mar 2009 Location: NorthWest Ohio, SouthEast Michigan Posts: 358 Upvotes: 0 Received 0 Upvotes on 0 Posts it may need to be set up in installers programming if you know the 4 digit installers code- star 9 ( \*8 ) ( installers code) the zone # with 10 in front of it- ( zone 1 = 101 zone 6 = 106) then make sure the #3 LED is on, this toggles on & off each time you press the 3, 3 off, chime for that zone is OFF, 3 on, chime ON - if its off- hit 3 then it should be lit- hit # (onetime) then enter the next zone- again with 10 in front of it, turn that "3" on, # and so fourth. ## to exit If you dont know what your doing, its risky- you could cause other problems. RECAP: \* 8 101 3 (should turn on #3 LED / icon #3) that is for zone #1- exit the programming by hitting ## if the #3 is ON- then it should chime. default turns ALL zones on for chime if they are defined as DELAY or INSTANT in zone definition programming. Join Date: Mar 2009 Posts: 4 Upvotes: 0 Received 0 Upvotes on 0 Posts the 3 is lite up in all the zones i want to chime but still no chime Join Date: Mar 2009 Location: NorthWest Ohio, SouthEast Michigan Posts: 358 Upvotes: 0 Received 0 Upvotes on 0 Posts OK... keypad programming- \*8 \_ \_ \_ \_ 000 6 option 6 & 7 ON ( LED's 6 & 7 ON ) ## ## to exit ( NOTE iam adding 000 after the installers code- this is to go to keypad programming- that turns on chime for both OPENINGS & CLOSINGS ( 6 = open, 7 = close ) LED 6 off, NO chime for openings, LED 7 off, NO chime for closings ## ## to exit next - keypad program- \*8 \_ \_ \_ \_ then the zone number 01, 02, 03 etc... (2 digits- zones 1-9 add 0 in front) NOTE \* after installers code LED # 1 on, ALL others OFF go to the next zone, enter zone # (2 digits) turn on 1, all others off ## ## to exit ( do this for every zone that you want to chime) Last edited by LOCKtec; 03-28-09 at 05:58 AM. Join Date: Mar 2009 Posts: 4 Upvotes: 0 Received 0 Upvotes on 0 Posts thanks so much that worked \*8 5010 000 6, 6 the number was not on now its is and chimers are working Digital Security Controls(DSC)is a company that manufactures and distributes innovative home security systems in 140 countries. Theirhome and business security systems include state-of-the-art control panels, IP monitoring products, wireless panels, and various sensors and detectors. Like other alarm security systems, DSC alarms are also susceptible to faults. However, their alarm systems are one of the easiest to program, diagnose and troubleshoot. Some of the issues you may experience include power failure, communication issues, and malfunctioning components. Our article below will help you configure your system and provide troubleshooting tips to ensure your home is secure. Your alarm is ready for programming after wiring and mounting. Below is the programming guide to get your DSC alarm running. First, write down a list of all the zone numbers and the type of zones in your system. The zones are all the protected areas connected to one or more sensors. They include:[001] Zone definitions(zone 1-16)[002] Zone definitions(zone 17-32)[003] Zone definitions(zone 33-48)[004] Zone definitions(zone 49-64) Only section 001 is necessary unless you have more than 16 zones.Enter the section number then the zone number to program each of the 16 zones in the section. Any unoccupied zones should be 00.Program the alarm panel by entering Installer Programming on the keypad. The default installer code is 5555.The Enter section of the Program light will flash on the LED keypad.Note that when programming # button exits the section, and ## exits programming. The alarm system is ready for arming if the Ready light is on. If the Ready light is off, ensure all the doors and windows are closed and no motion in those areas covered by motion detectors.Enter the access code. If the access code is correct, the keypad will beep rapidly, and the Armed light will turn on.The keypad will sound steadily for one second to indicate an incorrect access code. When this happens, press the # button and then re-input the access code.Then exit the premises through the designated Entry/Exit door. Enter the house through the designated Entry/Exit door.The keypad will beep as soon as you open the door to indicate you should disarm the system.Enter the access code on the keypad before the entry delay period expires.If you enter the incorrect code, re-enter the code. Access codes help to arm and disarm the DSC alarm system. There are 37 access codes: Press [\*][5][current Master code][40][new Master code].The Master code should be a 4 digit number. Write down your new Master code on the list you created above. Enter [\*][5][Master code][code number between 01 to 32][new access code].Press # to exit.If a similar access code exists, the new number will replace it. Record your new access code.To delete an access code: Enter [\*][5][Master Code][code number 01 to 32][\*].Press #to return to the Ready state.Note that you cannot erase the Master code. There could be several reasons that are causing your DSC alarm to keep beeping abnormally. The most likely reason is the alarm has detected one or more trouble codes. Other reasons include battery malfunction, phone line failure, low battery and communication issues. The best way to stop the beeping is first to disarm the alarm and then diagnose the issue. You silence the beeping by disarming it; enter the disarm code and press \*. You can also try switching off the door chime feature. Each time someone opens or closes a door or window, the door chime feature produces a beep from the keypad. You can program which doors and windows have the chime feature. Press and hold the Chime button on the keypad with function keys to switch off the chime feature. For keypads without a Chime button, press \*4. To display the trouble codes on the keypad, press the \* button and then number 2. Below are the DSC alarm system trouble codes and their meanings. CodesPossible meaningPossible solution1Low batteryIf you recently had a power outage, wait 24 hours after power comes back for the battery to recharge.If beeping persists after 24 hours, replace the battery.2Loss of AC powerMake sure the transformer is plugged securely into the outlet.If it is not working, check the circuit breaker and reset any tripped breakers.If the problem persists, replace the transformer.3Telephone line issuesPlug the home phone into the telephone jack and check for a dial tone. Check for disconnections between the panel and the phone box.If you changed your cable telephone recently, update your system. Contact your security company to check for further damaged connections.If there is no dial tone, the phone service is down, and you need to contact your phone service provider.4Communication failure with the central stationThe panel isnt reaching the monitoring station, which is how the system reports emergencies to the authorities. If fixing the phone line doesnt work, contact the alarm company to check the system.5Zone faultError codes 5,6, or 7 indicate an issue with the system sensors.Press the number on the keypad to show the specific zone with the issue Check for loose connections on the wireless sensor. If the problem continues, contact the alarm company.6Zone tamperCheck the cover of the affected zone or sensor and ensure it fits securely.7Low zone batteryReplace the batteries of the affected wireless sensors.8Loss of time and dateIf the system has lost AC and battery power, reprogram the time and date when it regains power.The panel model might also not be capable of daylight saving time.Set the date and time. Press the [\*][6][Master Code][1].Enter the time in 24-hour format.Set the current date in MM/DD/YY format.Press # to exit.If the issue persists, reset the alarm system by arming and disarming the system. A yellow triangle light on the DSC alarm indicates a trouble light; therefore, there is an issue you need to resolve. A trouble light could mean a number of problems usually indicated by an error code. Press [\*][2] on the keypad, the zone lights will come on, and a trouble code corresponding to the specific issue will appear on the display screen. Reference the table above to determine what the trouble code means and how you can fix it. Once you clear the trouble code, the triangle light also clears. To clear a trouble code on your DSC system, enter your master code twice, press the reset button once, and enter [\*][72]. Then, when the alarm goes off, determine the trouble code that triggered the alarm and troubleshoot it to prevent a faulty alarm. Clearing the DSC alarm memory will delete all the programmed settings, and you will have to reprogram the system after. To delete the DSC alarm memory, arm and then disarm the system. Enter the Master code, and the system will immediately disarmIn case you enter an incorrect code, press # and try again. Locate the disarm button with an unlocked lock.Press # and hold the disarm button on the programmed key chain remote while within the range of the alarm system. If your DSC system is an Alarm.com, log into your account, and under the security tab, select disarm. The system will disarm once it receives the command from Alarm.com. Note that you can only reset specific sensors such as smoke detectors and glass break detectors after an alarm. To clear the detectors, press and hold the Reset button for two seconds. If they fail to reset, they may still be detecting an alarm condition. Check the detectors and try resetting again. If the batteries drain after a power outage, you will need to reset the wireless sensors using the keypad. To reset your DSC alarm without the Master code: Open the access code on the control unit.Press and hold the RESET button for 2 seconds.Press 72 if the alarm continues ringing.Check the system to determine the underlying problem such as power failures, phone line problems, glass breaks or an activated smoke detector. Typically the DSC alarm system uses AC to run. However, it has a backup battery during a power outage. When the power comes back, the panel recharges the battery automatically. If you notice two triangles flashing on the display panel on the keypad, the battery is failing and needs replacing. The DSC alarm system has keypads, control panels, and sirens, which will require battery changes from time to time. Follow the steps below to replace the alarm batteries. Dismount the keypad from the bracket by pushing it up and out. Some models will require you to unscrew it from the mounting bracket.Turn to the back of the keypad and open the battery compartment cover.Remove the used batteries.Insert the new four AA batteries using the diagram at the back of the keypad for correct polarity orientation.Replace the cover and mount the keypad onto the wall mount. Press the tab at the front to open the cover.Remove the used batteries.Wait 30 seconds and then insert the new batteries into the compartment.Replace the front battery cover.Press and hold the test-siren button for five seconds to test the siren. The siren will beep if the battery change is successful. Locate the control panel box. Avoid confusing the control panel box with the keypad that arms and disarms the security system.Remove the screws on the side and bottom to open the control panel box.Pull out the black wire connector from the negative(-) battery terminal with pliers.Pull out the red wire connector from the positive(+) battery terminal.Remove the old battery from the control panel box.Insert the new battery inside the control panel box.Attach the new battery's red wire to the positive terminal and push the connector securely onto the terminal.Attach the black wire to the negative terminal on the new battery and push the connector securely onto the terminal.Check the alarm keypad for the trouble code. If the code is on display, the new battery needs AC power to recharge.Confirm the alarm system is working correctly and then close the control panel box cover. Arming the DSC alarm system puts it into a secured state. Typically, if your system is not arming, it suggests that there is a power failure. The DSC alarm system has a backup battery to keep it armed during a power outage. Failure to arm the systems puts your security and smoke detection at risk. Follow the troubleshooting tips below to get your alarm system appropriately armed. The battery could be running low or is completely flat if the system refuses to work. To ensure your alarm system goes into arming mode correctly, check the batteries to the control panel, keypad and sensors and replace them if necessary. If there is power in your home, but the alarm system is not armed, check for tripped breakers. Sometimes power outages and surges can trip the circuit breaker and prevent the system from receiving power. When the system doesnt receive power, the batteries also do not recharge. Check the circuit breaker and manually flip the circuit breaker off and then on. The DSC alarm systems also have a step-down transformer that plugs into an alternating current outlet. If there is AC power and the batteries are also working, but the system isnt arming, the transformer is likely failing. First, check the transformer and ensure it has securely plugged into the power outlet. Next, confirm the other end with a single plug is inserted firmly into the central alarm unit by disconnecting and reinserting it. If the issue doesnt resolve, replace the transformer. DSC alarm system should beep every time you open or close a door or window with a sensor. However, on rare occasions, the door will not chime when you open the door. Follow the troubleshooting steps below to get your Chime function working again. Check to ensure the chime function is enabled. Turn it on by pressing and holding the Chime button on the keypad for 2 seconds. You can also press [\*][4]. Finally, test the door and if it should beep three times if the chime is on. If it is off, the system will produce a long tone. Confirm the door sensor is activated. To test this, turn off your alarm system and check if the sensor was recently triggered. Ensure the sensor is programmed to switch off the main power supply automatically after some time. If it has, you should disconnect the sensor battery, reattach it, and set the current time and date. Check for power to the system. During a power outage, the system usually works on the backup battery. But if the battery is completely dead, the alarm system wont work. Check the circuit breaker and reset any tripped switches. Then check the batteries on the sensors and keypad and replace them if necessary. Check the door to ensure the contacts are not loose or damaged. When the sensor contact is damaged or disconnected, the alarm system will not notify you in case of an intruder. If they are, set the system to bypass the zone where the door is and then reconnect the contacts or replace them. When replacing the contacts, make sure to use a replacement door sensor and magnet compatible with your current system, or the control panel will not recognize it. The DSC alarm system directly connects to the phone line, which allows it to communicate with the monitoring department about a break-in, fire, or other safety hazards when the system is triggered. Usually, phone line repair work can interrupt the connection with the alarm system to cause a communication failure. The most probable reasons for this could be a disconnected phone line, a change in phone service, a phone issue, or a change in the phone service provider. Here is how you can solve the communication issue: Check the phone line firmly connects to the systems control panel. Next, check both ends by disconnecting and reconnecting the cable firmly. Then, perform a test to ensure it is working correctly.If the monitoring station does not receive the test message, the system is not programmed to send test signals. You have to contact your DSC support for an onsite service call.Communication failure could also be due to a frozen cellular unit. You can resolve this by rebooting your DSC alarm system. Then conduct a communications test to see if the issue has cleared. If the communications test fails, you will need a service call. A communication test will cause the siren to go off for 2 seconds and ensure that all the monitoring station before the test. This keypad has words in the right-hand column of the keypad. Press [\*][6][Master code].Select option will appear on display.Press the right arrow once and then look for System test.Press [ ], and the siren will sound for 2 seconds.Call the monitoring station to confirm if your signal went through.If it didnt go through, request for an onsite visit. The alarm system battery delivers backup power to run the system during power loss. The DSC alarm system uses 12-Volt batteries that typically last between 3-5 years. When the battery has fully discharged, a trouble light code 7 or low batt will appear on display. Try replacing the battery, and if the problem persists and you have an older system, you should consider replacing the system. A dead keypad will not beep or have lights on it, indicating a problem with the power supply to the keypad. Try the troubleshooting steps below to get your alarm keypad working: Reset your alarm system to factory default to clear out minor bugs that could be affecting your system. After the reset, reprogram the system.Confirm the keypad is receiving power by removing the battery from the back of the battery cover. Wear ear defenders in case the alarm is triggered. The keypad will produce two beeps.Make sure the batteries are correctly in position by checking the polarity.Check the transformer plugged into a working AC outlet. Test the outlet by unplugging it and connecting another electrical device. If the device doesnt power up, check the circuit breaker and reset any tripped breakers.If the keypad problem continues, you should call a DSC technician to fix the issue. The alarm control panel is the primary controller of the alarm security system. Its a computer that arms and disarms the security systems, communicates with all the components, sounds the alarm, and signals the monitoring station on security breaches. A faulty control panel might show zone faults which make it difficult to set the alarm. Check the most probable alarm panel faults and repairs below. The backup battery requires AC power to recharge. If there is a prolonged power blackout, the security system will go off until power comes back. You can get your panel working by replacing the dead battery with a charged battery. After four years, the battery is likely to stop recharging and will require a replacement. The sensors detect motion and signal the panel to sound an alarm and communicate with the monitoring station. Sometimes these the pin in the sensors jam or loosen, preventing the alarm from being triggered. The solution is to detect the faulty sensor and install it properly or replace it then test it. You should also perform regular maintenance of the sensors to prevent this issue. Loose connections can cause the alarm system to fail in several ways. The wires or cables connect the components to the main power supply, and if they are loose or damaged, the panel will not work correctly. Inspect all the connections in the system and ensure they are firm and secure. Wires can also become frayed or corroded and will require replacement. Check all the screws are tightly fitted and replace any missing screws. If all the above solutions do not help, the control panel may have malfunctioned from a power surge. The most cost-effective solution is to change the control panel and keypad with identical ones instead of replacing the entire system. If the siren fails to sound the alarm when the system is triggered, there are several ways you can diagnose and fix the issue. The siren is in service mode. Check if the alarm system is in service mode. Enter the test mode by disarming the keypad, use the arrow keys to scroll to User Functions and then press [\*] to perform an alarm test. Activate each sensor and check the zone light turns on when triggered. The zone light will go off once the system goes back to normal. If the zone light does not go off, the system is in service mode. Press [#] to go back to operating mode.If the above step does not work, attempt resetting the alarm system.A power cut can also explain an alarm siren thats not working. Check the siren battery and replace it if necessary. Check this too: Zmodo Doorbell Set up, Troubleshooting & How-to Guide The default master code for the DSC system is 1234. The master code allows the user to do a few things on the alarm system. After installing the system, you should change the default master code to a 4-digit number that only you know and prevent intrusion. If you have forgotten the master code, the only way to find it is in the installer menu and follow the steps below. Enter [\*][8][5555] on the keypad. This is the default installer code that allows you into programming mode.Enter 007 if you have the latest DSD system model. Your Master code will appear on the keypad screen. Press the right arrow key to view all four digits.Press [#] to go back to ready mode. To change an access code to your DSC system: Press [\*][5][Master Code].The Armed light will come on, and the Program light will start flashing. Enter the 2-digit user code you want to change(the code can be from 01 to 32).Press the arrow keys to scroll to the user you want to program and press [\*].Use the number keys to enter a new four-digit access code.After programming is successful, you can press another 2-digit user code to program another access code.Press [#] to exit programming. Follow the steps below to program the date and time on your DSC alarm. Press [\*][6][Master Code].Enter the number of the date and time function, that is, 1.Set the time in the 24-hour format (HH:MM)Enter the date in the (MM-DD-YY) format.Press [#] to exit programming. The DSC alarm system is one of the most reliable security alarms, but they are not flawless. With the help of the article above, you can troubleshoot the most commonly reported problems by DSC users. Try to perform a test on your system every week to ensure all sensors and detectors are working correctly. We also recommend having a regular maintenance schedule to prevent breakdowns and ensure optimum performance of your system. 2. Doors do not beep when they open.This beep is called the chime feature. Ask the client to press and hold the CHIME button (or the button with the bell on it) until the panel beeps. Then open a door to verify the issue is resolved. Have you considered upgrading to a smart system? Call our office today to find out how! 1. My system will not stop beeping.If the system has a known issue but is continuing to beep, acknowledge it by pressing the # button. This will silence the beeping but will not resolve the issue. Refer to trouble list below to identify cause. 3. Change master/user code.To change the master code, press the \* button and then the 5 button. Enter the current 4 digit master code. Enter 40. Enter the new 4 digit master code. Press the # button to exit programming. The master code is user 40, but the same steps can be to change or add any user number. 5. Little yellow triangle is on.This means there is a trouble on the system. Press \*2 on the keypad. One or more numbers will appear on the keypad. For an understanding on what the numbers mean, please refer to that number below.1. This is a system trouble. Press the 1 button. At this point, if it displays 1 again then it is a low panel battery. If 2 is displayed, then it is a siren issue. Either of these will require a service call.2. This means AC trouble. Ask client if the transformer (the white or off-white thing plugged into the wall) is plugged in. Assuming the building power is not off and the problem still exist, this will require a service call.3. This is an issue with the landline phone connection.4. This means the system has failed to communicate and has an issue with either the landline or the cell unit. This will require a service call. Please call our office for assistance.5 OR 6 This is saying there is a fault with one or more zones. Press the respective number showing. The number(s) flashing on screen is the zone having the issue. Press the RIGHT arrow key on the top left corner of the keypad to scroll through the list of zones. If more than one number flashes, more than one zone has this issue. If one number flashes, one zone has this issue. If the zones are wireless, it is possible the battery has completely died and is causing the issue. If this is the case, number 7 will be shown in addition to 5 at the beginning. This will require a service call if left unresolved.7. This means there is a wireless device with a low battery. Press number 7 on the keypad. The zone number with the issue will begin to flash. Press the RIGHT arrow key on the top left corner of the keypad to scroll through the list of zones. If more than one number flashes, more than one zone has this issue. If one number flashes, one zone has this issue.8. This indicates the system has lost the time and date. This does not require a service call. To reset the time and date, ask the customer to press the # symbol twice. Then press \*1, enter the MASTER Code. This is usually the code used to disarm the system. If the code is correct, the keypad will beep 3 times. If it does, press the 1 button. Now enter the current time in military time. For example, if it is 3:15pm we will enter 1515 after the time we will enter the date in MM/DD/YY format. For example, March 8th, 2017 will be entered as 030817 the panel will then beep 3 times to acknowledge the input. Press the # button and you are finished. 4. Number flashing on screen. This is the zone that is currently trigger. For example, if a door is open then the zone number should be shown on screen. If a door is closed and displaying zone number on the screen as open, then it will be an issue with the contact in the door frame or the magnet in the door. Join Date: Feb 2016 Location: USA Posts: 3 Upvotes: 0 Received 0 Upvotes on 0 Posts DSC Impassa Door Chimes I can't figure out why my front door chimers work and my basement and back door chimers do not. I have checked and Chimes is "on" and none of the zones have been bypassed. I did replace a room motion sensor in zone 4 and had no issues. When I turned off the test mode and checked the system - only the front door chimers functioned. Would love any insight anyone may have. Join Date: Jun 2000 Location: Gainesville, FL, USA Posts: 15,781 Received 350 Upvotes on 325 Posts What zone type are those zones programmed as? Could you have possibly programmed them as interior zones (which don't chime)? Join Date: Feb 2016 Location: USA Posts: 3 Upvotes: 0 Received 0 Upvotes on 0 Posts Well, that's the mystery. I replaced the motion sensor battery, programmed a key fab and when I went back and tested the only chimers that worked are on the front door. I did nothing else. Back and basement chimers worked fine before. I replaced the batteries in both door sensors (back/basement) and still nothing. Join Date: Jun 2000 Location: Gainesville, FL, USA Posts: 15,781 Received 350 Upvotes on 325 Posts Do you know how to view the content of a programming location? Join Date: Feb 2016 Location: USA Posts: 3 Upvotes: 0 Received 0 Upvotes on 0 Posts I do not any help would be appreciated.

**How to turn off door chime on dsc alarm. Dsc disable chime. Dsc chime off. Dsc door chime. Dsc door chime not working. How do i turn off the chime on my dsc alarm. How to set chime on dsc alarm.**
