## Horóscopo virgo 2025

The Southern Crab Nebula is a symbiotic nebula located approximately 10,700 light-years away in the southern constellation Centaurus (the Centaur). With an apparent magnitude of... Read More »Southern Crab Nebula (Hen 2-104) The Umbrella Galaxy is a spiral galaxy located 72 million light years away in the northern constellation of Coma Berenices (Berenice's Hair). It has an... Read More »Umbrella Galaxy (NGC 4651) The Pearl Cluster is a bright open cluster located 5,500 light-years away in the southern constellation of Centaurus (the Centaur). With an apparent magnitude of... Read More »Pearl Cluster (NGC 3766) The Cocoon Galaxy is a barred spiral galaxy located approximately 25.1 million light-years away in the northern constellation Canes Venatici (the Hunting Dogs). It has... Read More »Cocoon Galaxy (NGC 4490) Page 2 The Big Dipper is an asterism formed by seven bright stars in the northern circumpolar constellation Ursa Major, the Great Bear. It is one of... Read More »Big Dipper The Diamond Ring Nebula (Abell 33, A33) is a planetary nebula located approximately 2,700 light-years away in the constellation Hydra. The circular nebula lies behind... Read More »Diamond Ring Nebula (Lambda Centauri Nebula) is an emission nebula with an open cluster located approximately 6,500 light-years away in the constellation Centaurus. With... Read More »Running Chicken Nebula (IC 2944) The Owl Nebula, Messier 97 (M97), is a famous planetary nebula located at an approximate distance of 2,030 light-years in the northern constellation Ursa Major... Read More »Owl Nebula - Messier 97 The Intergalactic Wanderer (NGC 2419) is a distant but relatively bright globular cluster located approximately 275,000 light-years away in the constellation Lynx. With an apparent... Read More »Intergalactic Wanderer (NGC 2419) Page 3 The Frosty Leo Nebula (IRAS 09371+1212) is a bipolar protoplanetary nebula (PPN) located approximately 3,000 light-years away in the constellation Leo. It has an apparent... Read More »Frosty Leo Nebula The UFO Galaxy is a spiral galaxy located approximately 30.53 million light-years away in the northern constellation Lynx. It has an apparent magnitude of 10.6... Read More »UFO Galaxy (NGC 2683) The Owl Galaxy is a spiral galaxy located 447 million light-years away in the constellation Leo. With an apparent magnitude of 14.3 and an apparent... Read More »Owl Galaxy (NGC 3758) Page 4 The Gem Cluster (NGC 3293) is a young open cluster located approximately 8,400 light-years away in the southern constellation Carina (the Keel). With an apparent... Read More »Gem Cluster (NGC 3293) The Helix Galaxy is a lenticular polar ring galaxy located approximately 48.2 million light-years away in the constellation Ursa Major (the Great Bear). It has... Read More »Helix Galaxy (NGC 2685) The Hyades is a bright, large open cluster of stars located 153 light-years away in the constellation Taurus. It is the nearest open star cluster... Read More »Hyades The Bullseye Galaxy (LEDA 1313424) is a collisional ring galaxy (CRG) located approximately 534 million light-years away in the constellation Pisces. The galaxy is notable... Read More »Bullseye Galaxy (LEDA 1313424) The Hidden Galaxy is an intermediate spiral galaxy located approximately 10.7 million light-years away in the northern constellation Camelopardalis (the Giraffe). It is catalogued as... Read More »Hidden Galaxy (IC 342) The Rosette Nebula is a vast emission nebula located about 5,200 light years away. The star forming region lies near a large molecular cloud in... Read More »Rosette Nebula Page 5 The Monkey Head Nebula is an emission nebula located approximately 6,400 light-years away in the equatorial constellation Orion. The nebula has an apparent magnitude of... Read More »Monkey Head Nebula (NGC 2174) NGC 1333, also known as the Embryo Nebula, is a reflection nebula located 967 light-years away in the northern constellation Perseus. The nebula is an... Read More »NGC 1333 (Embryo Nebula) Cassiopeia A (Cas A) is the remnant of a supernova that occurred approximately 11,000 light-years away the constellation Cassiopeia. The light from the supernova... Read More »Cassiopeia A Page 6 The Cave Nebula is an emission nebula located approximately 2,400 light-years away in the northern constellation Cepheus. With an apparent magnitude of 7.7 and an... Read More »Cave Nebula (Caldwell 9) The Bat Nebula is a region of ionized gas within the larger Veil Nebula, an ancient supernova remnant located in the constellation Cygnus (the Swan)... Read More »Bat Nebula (IC 1340) The Spare Tyre Nebula is a planetary nebula located 3,000 light-years away in the southern constellation Crus (the Crane). It has an apparent magnitude of... Read More »Spare Tyre Nebula (IC 5148) The Superman Galaxy is a barred spiral galaxy located approximately 105 million light-years away in the northern constellation Pegasus. With an apparent magnitude of 11.6... Read More »Superman Galaxy (NGC 7479) The Fish Head Nebula is an emission nebula located approximately 6,000 light-years away in the northern constellation Cassiopeia. The nebula is 3.1 arcminutes across and... Read More »Fish Head Nebula (IC 1795) The Silver Sliver Galaxy is an unbarred spiral galaxy located approximately 27.3 million light-years away in the constellation Andromeda. With an apparent magnitude of 10.8... Read More »Silver Sliver Galaxy (NGC 891) Page 7 The Einstein Cross is a quasar located 8 billion light-years away in the constellation Pegasus. The quasar is gravitationally lensed by the galaxy ZW 2237+030... Read More »Einstein Cross The Trifid Nebula is a bright H II region located 4,100 light-years away in the southern constellation Sagittarius. With an apparent magnitude of 6.3 and... Read More »Trifid Nebula (Messier 20) The Little Gem Nebula is a planetary nebula located approximately 6,000 light years away in the constellation Sagittarius. It has an apparent magnitude of 10... Read More »Little Gem Nebula (NGC 6818) The Glowing Eye Nebula is a planetary nebula located approximately 6,500 light-years away in the constellation Aquila (the Eagle). The nebula has an apparent size... Read More »Glowing Eye Nebula (NGC 6751) The Blue Snowball Nebula is a bright planetary nebula located approximately 5,730 light-years away in the constellation Andromeda. With an apparent magnitude of 8.3 and ... Read More »Blue Snowball Nebula (NGC 7662) Page 8 The Perseid meteor shower is an annual meteor shower that occurs from July 23 to August 20. It is associated with the comet Swift-Tuttle. The... Read More »Perseid Meteor Shower The Boomerang Nebula (ESO 172-7) is a protoplanetary nebula located approximately 1,213 light-years away in the constellation Centaurus. Also known as the Centaurus Bipolar Nebula... Read More »Boomerang Nebula The Turtle Nebula is a planetary nebula located approximately 5,400 light-years away in the northern constellation Hercules. It has an apparent magnitude of 9.30. It... Read More »Turtle Nebula (NGC 6210) The Horsehead Nebula (B33) is a famous dark nebula located in the constellation Orion. It is part of the Orion Molecular Cloud Complex, one of... Read More »Horsehead Nebula Page 9 Omega Centauri (ω Centauri) is a bright globular cluster located approximately 17,090 light-years away in the southern constellation Centaurus. With an apparent magnitude of 3.9... Read More »Omega Centauri (NGC 5139) The Pencil Nebula is the brightest part of the larger Vela Supernova Remnant, one of the closest supernova remnants to the Sun. The nebula has... Read More »Pencil Nebula (NGC 2736) The Spaghetti Nebula is a supernova remnant located approximately 3,000 light-years away in the constellation Taurus, on the border with Auriga. The remnant lies near... Read More »Spaghetti Nebula The Vela Supernova Remnant (Vela SNR) is the remnant of a supernova that occurred around 11,000 years ago in the southern constellation Vela. The remnant... Read More »Vela Supernova Remnant The Gum Nebula is a large emission nebula located approximately 1,470 light-years away. It occupies 36 degrees of the apparent sky in the direction of... Read More »Gum Nebula The Westbrook Nebula is a bipolar protoplanetary nebula located between 2,900 and 5,500 light-years away in the northern constellation Auriga (the Charioteer). It is classified... Read More »Westbrook Nebula Page 10 The Lemon Slice Nebula is a planetary nebula located approximately 4,500 light-years away in the constellation Camelopardalis. It lies in the region of the north... Read More »Lemon Slice Nebula (IC 3568) The Large Magellanic Cloud (LMC) is a Magellanic spiral galaxy located 163,000 light-years away. It is the brightest satellite galaxy of the Milky Way and... Read More »Large Magellanic Cloud The Tarantula Nebula is a vast star-forming region located approximately 160,000 light-years away in the southern constellation Dorado. The region of ionised hydrogen gas is... Read More »Tarantula Nebula (30 Doradus) Page 11 The Ghost Head Nebula is an emission nebula located approximately 160,000 light-years away in the Large Magellanic Cloud in the constellation Dorado. The star-forming region... Read More »Ghost Head Nebula (NGC 2080) The Red Rectangle Nebula is a protoplanetary nebula located approximately 2,300 light-years away in the constellation Monoceros. It has a radius of 0.14 light-years. The... Read More »Red Rectangle Nebula Orion's Sword is a prominent asterism located below the brighter Orion's Belt in the constellation Orion. It is part of the recognizable constellation figure representing... Read More »Orion's Sword The Bow-Tie Nebula is a planetary nebula located approximately 5,280 light-years away in the northern constellation Cepheus. With an apparent magnitude of 11.6, it can... Read More »Bow-Tie Nebula (NGC 40) The Angel Nebula is a reflection nebula located approximately 2,700 light-years away in the equatorial constellation Monoceros (the Unicorn). It is part of Monoceros R2... Read More »Angel Nebula (NGC 2170) The Flame Nebula is a bright emission nebula located 900 - 1,500 light-years away in the constellation Orion, the Hunter. The large star-forming region has... Read More »Flame Nebula (NGC 2024) Page 12 The Bubble Nebula is an emission nebula located 7,100 - 11,000 light-years away in the northern constellation Cassiopeia. With an apparent magnitude of 10, it... Read More »Bubble Nebula (NGC 7635) The Alpha Persei Cluster is a bright open cluster located approximately 570 light-years away in the northern constellation Perseus. With an apparent magnitude of 1.2... Read More »Alpha Persei Cluster The Christmas Tree Cluster is a young open cluster located in the constellation Monoceros. It is part of the star-forming region NGC 2264, which also... Read More »Christmas Tree Cluster The Witch Head Nebula is a very faint reflection nebula located approximately 900 light-years away in the constellation Eridanus. The nebula is illuminated by the... Read More »Witch Head Nebula (IC 2118) The Owl Cluster is a bright open star cluster located approximately 7,922 light-years away in the northern constellation Cassiopeia. With an apparent magnitude of 6.4... Read More »Owl Cluster (NGC 457) The Skull Nebula is a bright planetary nebula located approximately 1,600 light-years away in the constellation Cetus. With an apparent magnitude of 8, it can... Read More »Skull Nebula (NGC 246) The Saturn Nebula (NGC 7009) is a small but bright planetary nebula located between 2,000 and 4,000 light years away in the constellation Aquarius. With... Read More »Saturn Nebula Page 13 47 Tucanae is a bright globular cluster located 14,500 light-years away in the southern constellation Tucana. With an apparent magnitude of 4.09, the cluster is... Read More »47 Tucanae NGC 7331 is an unbarred spiral galaxy located 39.8 million light-years away in the constellation Pegasus. With an apparent magnitude of 10.4, it can be... Read More »NGC 7331 The Dumbbell Nebula is a planetary nebula located approximately 1,360 light-years away in the northern constellation Vulpecula (the Fox). With an apparent magnitude of 7.4... Read More »Dumbbell Nebula (Messier 27) The Lagoon Nebula is a vast emission nebula located approximately 4,100 light-years away in the constellation Sagittarius. With an apparent magnitude of 4.6 and an... Read More »Lagoon Nebula (Messier 8) The Ring Nebula is a bright planetary nebula located approximately 2,567 light-years away in the constellation Lyra. With an apparent magnitude of 8.8, it is... Read More »Ring Nebula (M57) The Necklace Nebula is a planetary nebula located 15,000 light-years away in the northern constellation Sagitta. It has an apparent diameter of 0.35 arcminutes and... Read More »Necklace Nebula Page 14 The Lobster Nebula is a large emission nebula located approximately 5,900 light-years away in the constellation Scorpion. The nebula hosts several massive young star clusters... Read More »Lobster Nebula (NGC 6357) The Condor Galaxy is a large barred spiral galaxy located 212 million light-years away in the southern constellation Pavo (the Peacock). It is listed as... Read More »Condor Galaxy (NGC 6872) The Butterfly Nebula is a bipolar planetary nebula located approximately 3,400 light-years away in the constellation Scorpion. Named for its resemblance to a butterfly, the... Read More »Butterfly Nebula (NGC 6302) The Rho Ophiuchi cloud complex is a large complex of bright and dark nebulae located in the constellation Ophiuchus. It is located approximately 460 light-years... Read More »Rho Ophiuchi Cloud Complex The Cat's Eye Nebula is a planetary nebula located approximately 3,300 light-years away in the northern constellation Draco. Its intricate shape and colourful appearance have... Read More »Cat's Eye Nebula (NGC 6543) The Fish Hook is an asterism formed by about a dozen bright stars in the constellation Scorpion. The curved star pattern forms the heart, body... Read More »The Fish Hook Kepler's Supernova (SN 1604) is the remnant of a supernova first observed in the constellation Ophiuchus in October 1604. The supernova occurred in the Milky... Read More »Kepler's Supernova Page 15 The Tadpole Galaxy is a peculiar disrupted barred spiral galaxy located approximately 420 million light-years away in the constellation Draco. It has a disrupted shape... Read More »Tadpole Galaxy The Southern Ring Nebula (Eight-Burst Nebula, NGC 3132) is a planetary nebula about 2,000 light-years away in the southern constellation Vela. With an apparent magnitude... Read More »Southern Ring Nebula The Ant Nebula is a bipolar planetary nebula located approximately 8,000 light-years away in the southern constellation Norma. It has an apparent magnitude of 13.8... Read More »Ant Nebula The Circinus Galaxy is a Seyfert galaxy located 13 million light-years away in the southern constellation Circinus. It is one of the closest active galaxies... Read More »Circinus Galaxy The Carina Nebula is a vast region of bright and dark nebulosity located in the southern constellation Carina. It is also known as the Eta... Read More »Carina Nebula The Antennae Galaxies, also known as the Ringtail Galaxy, are a pair of colliding galaxies located in the constellation Corvus. The collision has produced two... Read More »Antennae Galaxies Page 16 Spica's Spanker is a quadrilateral asterism formed by the brightest stars in Corvus. Also known as the Sail, the asterism appears near Spica, the brightest... Read More »Spica's Spanker The Needle Galaxy is a barred spiral galaxy located approximately 30 - 50 million light-years away in the constellation Coma Berenices. It is one of... Read More »Needle Galaxy The Coma Star Cluster is an open cluster located 280 light-years away in the constellation Coma Berenices. With an apparent magnitude of 1.8 and an... Read More »Coma Star Cluster The Wishing Well Cluster (NGC 3532) is a bright open cluster located approximately 1,321 light-years away in the southern constellation Carina. It has an apparent... Read More »Wishing Well Cluster Barnard's Loop is a large emission nebula within the Orion molecular cloud complex, a vast star-forming region located in the constellation Orion. The nebula appears... Read More »Barnard's Loop Page 17 The Cone Nebula is an H II region located in the equatorial constellation Monoceros, the Unicorn. The pillar of gas and dust lies at an... Read More »Cone Nebula The Seagull Nebula (IC 2177) is a large region of nebulosity located approximately 3,650 light-years away in the constellation Monoceros (the Unicorn), on the border... Read More »Seagull Nebula Auriga's hexagon is a bright, prominent asterism formed by the brightest stars of Auriga - Capella, Menkalinan, Mahasim, Hassaleh, and Almaz - with Elnath, the... Read More »Auriga's Hexagon The Tadpole Nebula (IC 410) is an H II region located approximately 12,400 light-years away in the northern constellation Auriga. It is associated with the... Read More »Tadpole Nebula (IC 410) The Flaming Star Nebula (IC 405) is an emission and reflection nebula located approximately 1,500 light-years away in the northern constellation Auriga. The nebula surrounds... Read More »Flaming Star Nebula (IC 405) The Retina Nebula is a bipolar planetary nebula located in the southern constellation Lupus. It has an apparent magnitude of 11 and lies approximately 2,000... Read More »Retina Nebula (IC 4406) Page 18 The Winter Triangle, or the Great Southern Triangle, is an asterism formed by Betelgeuse, Procyon, and Sirius. The three bright stars form an equilateral triangle... Read More »Winter Triangle The 37 Cluster, also known by its New General Catalogue designation NGC 2169, is a small open cluster located in the constellation Orion. With an... Read More »37 Cluster (NGC 2169) The Sculptor Galaxy is an intermediate spiral galaxy located approximately 11.4 million light-years away in the southern constellation Sculptor. It is one of the brightest... Read More »Sculptor Galaxy (NGC 253) Orion's Belt is a prominent asterism formed by three stars in the constellation Orion. The three bright blue stars - Alnitak, Alnilam, and Mintaka -... Read More »Orion's Belt The Medusa Nebula (Sh2-274) is a large planetary nebula located 1,500 light-years away in the constellation Gemini. With an apparent magnitude of 15.99, the nebula... Read More »Medusa Nebula The Iris Nebula is a bright, large reflection nebula located approximately 1,300 light-years away in the constellation Cepheus. With an apparent magnitude of 6.8, the... Read More »Iris Nebula Page 19 The Ghost Nebula is a reflection nebula located approximately 1,470 light-years away in the constellation Cepheus. The nebula's dust and gas form eerie-looking figures that... Read More »Ghost Nebula Seyfert's Sextet is a compact group of galaxies located approximately 190 million light-years away in the constellation Serpens. The group was named after American astronomer... Read More »Seyfert's Sextet The Northern Cross is a prominent asterism formed by the brightest stars in the constellation Cygnus. Deneb, Sadr, and Albireo form the pole, and Fawaris... Read More »Northern Cross Hoag's Object is a ring galaxy located about 612.8 million light-years away in the constellation Serpens. Recognizable for its nearly perfect ring shape, the galaxy... Read More »Hoag's Object The Cartwheel Galaxy is a ring galaxy located in the southern constellation Sculptor. It lies at an approximate distance of 500 million light-years from Earth... Read More »Cartwheel Galaxy The Southern Cross is an asterism formed by the brightest stars in the constellation Crux. Largely unknown to observers in the northern hemisphere, it is... Read More »The Southern Cross Stephan's Quintet is a group of four interacting galaxies - NGC 7317, NGC 7318A, NGC 7318B, and NGC 7319 - and a visual companion, the... Read More »Stephan's Quintet Page 20 The California Nebula is a large emission nebula stretching across almost 2.5 degrees of the night sky in the constellation Perseus. It has an apparent... Read More »California Nebula The Diamond Cross is one of the three prominent cross asterisms in the far southern sky. Located in the constellation Carina, the asterism is formed... Read More »Diamond Cross Sagittarius A (Sgr A) is a complex radio source located at the centre of the Milky Way Galaxy. The radio source consists of the supernova... Read More »Sagittarius A The Little Dipper is an asterism formed by seven bright stars in the constellation Ursa Minor, the Little Bear. It is smaller and fainter than... Read More »Little Dipper The Ghost of Jupiter (NGC 3242) is a planetary nebula located approximately 4,800 light years away in the constellation Hydra. With an apparent magnitude of... Read More »Ghost of Jupiter Nebula The constellation Cassiopeia has long been known by its popular nickname, the W constellation. Its five brightest stars form the distinctive shape of a W... Read More »Cassiopeia's W Page 21 The Pointer Stars are the two bright stars in Ursa Major that can be used to find Polaris, the North Star. The two stars, Dubhe... Read More »Pointer Stars The Cocoon Nebula (IC 5146) is a reflection/emission nebula located approximately 2,500 light years away in the constellation Cygnus. With an apparent magnitude of 7.2... Read More »Cocoon Nebula The Water Jar is an asterism formed by four relatively bright stars in the constellation Aquarius: Gamma, Pi, Eta, and Zeta Aquarii. Also known as... Read More »Water Jar The Oyster Nebula (NGC 1501) is a planetary nebula located in the northern constellation Camelopardalis, the Giraffe. The nebula was created by an extremely hot... Read More »Oyster Nebula The Summer Triangle is an asterism formed by Vega, Altair and Deneb, the brightest stars of the northern constellations Lyra, Aquila and Cygnus. With three... Read More »Summer Triangle Page 22 The Egg Nebula is a protoplanetary nebula located in the northern constellation Cygnus. It lies at an approximate distance of 3,000 light years and has... Read More »Egg Nebula The Whale Galaxy is a barred spiral galaxy located at an approximate distance of 30 million light years in the constellation Canes Venatici. It has... Read More »Whale Galaxy (NGC 4631) The Pacman Nebula (NGC 281) is a large emission nebula appearing near the orange giant Schedar in the constellation Cassiopeia. The nebula lies approximately 9,200... Read More »Pacman Nebula The Mice Galaxies (NGC 4676) are a pair of colliding galaxies located in the constellation Coma Berenices. The two galaxies - designated IC 819 and... Read More »Mice Galaxies The Jewel Bug Nebula (NGC 7027) is a young planetary nebula located in the constellation Cygnus. It lies approximately 2,870 light years away. With an... Read More »Jewel Bug Nebula The Kite is a large northern asterism that dominates the constellation Boötes. Also known as the Ice Cream Cone, it is formed by the constellation's... Read More »The Kite The Dragonfish Nebula is a vast emission nebula located in the constellation Crux. Invisible in visible light, the nebula got its name because its appearance... Read More »Dragonfish Nebula Page 23 The Spirograph Nebula (IC 418) is a planetary nebula located approximately 3,600 light years away in the constellation Lepus. It lies near the ears of... Read More »Spirograph Nebula IC 1101 is a supergiant elliptical galaxy located in the constellation Virgo. With a radius of about 2 million light years and home to 100... Read More »IC 1101 The False Cross is an asterism formed by four bright stars in the constellations Vela and Carina. Located in the far southern sky, the diamond-shaped... Read More »False Cross Page 24 The Sickle of Leo is one of the most recognizable patterns in the spring sky. Formed by some of the brightest stars in the constellation... Read More »The Sickle Page 25 The Crystal Ball Nebula (NGC 1514) is a planetary nebula located in the constellation Taurus, near the border with Perseus. It has an apparent magnitude of 9.43 and lies at an approximate distance of 2,200 light years (700 parsecs) from Earth. It occupies an area of 2.2 arc minutes. Read More »Crystal Ball Nebula The Keystone is an asterism formed by four relatively bright stars in the constellation Hercules: Pi, Eta, Zeta and Epsilon Herculis. The trapezoid-shaped pattern makes it easy for observers to identify the constellation and to find several well-known deep sky objects. On a clear night, the Keystone can be seen between the bright Vega, the brightest star in Lyra, and the stars of Corona Borealis, the Northern Crown. The asterism represents Hercules' torso. Read More »The Keystone Page 26 Copeland's Septet, also known as Hickson Compact Group 57 (HCG 57) and Arp 320, is a group of interacting galaxies located in the constellation Leo. Read More »Copeland's Septet Algol, Beta Persei, is a bright multiple star located in Perseus. It is the second brightest star in the constellation, after Mirfak, Alpha Persei. The... Read More »Algol The Elephant's Trunk Nebula is a dense region of dust and gas found within the considerably larger star forming region IC 1396 in Cepheus constellation... Read More »Elephant's Trunk Nebula Conocé las predicciones y qué le depara el horóscopo a Virgo este martes 20 de mayo de 2025 en cuestiones de salud, amor y dinero. Cortés, lúcido, honesto, prolijo, trabajador, Virgo es el eterno perfeccionista en búsqueda de un ideal. De mente hábil e intelectual, con él tenemos que estar atentos a todos los detalles ya que un pequeño olvido puede lastimarlo mucho. Aunque es muy paciente, critica todo lo que ve; no debemos sentirnos mal por eso, lo hace con cariño y siempre quiere que todo sea perfecto. No tiene problemas en recibir órdenes y es muy servicial. Qué le espera a Virgo el martes 20 de mayo Día propicio para disfrutar de la amistad y de las relaciones en general. Haz algunas llamadas y encuéntrate con amigos. Salud; Tienes un complejo de inferioridad, te sentirás víctima y te costará relacionarte. Tendrás que adquirir mayor confianza en ti mismo.Amor: Tu familia y tu pareja se mostrarán hoy muy cariñosas. Disfruta pero no abuses, para que se repita con más frecuencia.Dinero: Es vital que no queden asignaturas pendientes con el pasado. Solo si das vuelta la página prosperarás en lo material. Virgo es el sexto signo del zodiaco. Su elemento es la tierra, al igual que el de Tauro yCapricornio. Pertenecen al signo de Virgo las personas nacidas entre el 24 de agosto y el 23 de septiembre. ¡Seguí leyendo más sobre astrología y horóscopo! Y lee el horóscopo 2025 para cada signo y cómo te irá este año según la numerología. Si querés saber todo sobre las fases de la Luna, seguí el calendario lunar 2025 y enterate cómo está la Luna hoy. ¿Ya sabés cómo será tu semana? ¡Lee el horóscopo semanal para tu signo!
